

Forest of Dean  
— DISTRICT COUNCIL —

# 2020 Air Quality Annual Status Report (ASR)

In fulfilment of Part IV of the  
Environment Act 1995  
Local Air Quality Management

July 2020

## Forest of Dean District Council

Local Authority Officer	David Rudland
Department	Environmental & Regulatory Services
Address	Council Offices, High Street, Coleford, Gloucestershire, GL16 8HG
Telephone	01594 810000
E-mail	ers@fdean.gov.uk
Report Reference number	FoD ASR 2020.1
Date	July 2020

## Executive Summary: Air Quality in Our Area

Air quality across the Forest of Dean District remains very good, with measured levels of nitrogen dioxide (NO<sub>2</sub>) generally well within national limits.

We have one Air Quality Management Area (AQMA) in the District which is in Lydney and was declared in July 2010. It was identified that traffic congestion (at the T-junction between the High Street and the Bream Road) was the most likely cause of the nitrogen dioxide (NO<sub>2</sub>) levels which exceeded the national air quality objectives at the time the AQMA was declared.

Monitoring throughout 2019 has not identified any other exceedances of the national objectives within the Forest of Dean District.

This year the diffusion tube survey results were similar to the previous year's (plus or minus 1-2 ug/m<sup>3</sup>). Within the AQMA, the results were again similar to last year's, close to and in one location just above (40.7 ug/m<sup>3</sup>) the national air quality objective of 40ug/m<sup>3</sup>. These monitoring points within the AQMA were the only sites with nitrogen dioxide levels within 10 per cent of the annual average air quality objective (i.e. above 36 ug/m<sup>3</sup>).

As pollutant concentrations may vary significantly from one year to the next, due to the influence of meteorological conditions, it is not desirable to revoke our AQMA whilst we have sites still measuring levels within 10% of the national objective level, set to protect health. Our monitoring survey around the District will continue, in conjunction with planning controls in accordance with national guidance, to try to ensure that pollution levels do not approach the national air quality objective and that those within our AQMA remain closely monitored.

Within Forest of Dean District Council's administrative area there are no point sources of pollution that give rise to concern in respect of air quality. No new or significantly changed sources have been identified within the district. All proposed residential and industrial developments are considered with regard to their potential to increase traffic pollution in the AQMA and other areas.

## Air Quality in Forest of Dean District

Air pollution is associated with a number of adverse health impacts. It is recognised as a contributing factor in the onset of heart disease and cancer. Additionally, air pollution particularly affects the most vulnerable in society: children and older people, and those with heart and lung conditions. There is also often a strong correlation with equalities issues, because areas with poor air quality are also often the less affluent areas<sup>1,2</sup>.

The annual health cost to society of the impacts of particulate matter alone in the UK is estimated to be around £16 billion<sup>3</sup>. In common with most local authority districts in England and Wales, the main pollutant of concern within Forest of Dean District is nitrogen dioxide from road traffic. Nationwide, levels of nitrogen dioxide have been steadily falling over the years.

We deploy a number of diffusion tube monitors across the District, measuring nitrogen dioxide as part of an ongoing survey. These are collected and sent for analysis on a monthly basis.

Air quality across the Forest of Dean District remains very good with measured levels of nitrogen dioxide (NO<sub>2</sub>) generally well below national limits.

The nitrogen dioxide diffusion tube survey results were similar to those recorded last year. Our 2019 monitoring programme confirms that within the Lydney Air Quality Management Area (AQMA), the nitrogen dioxide annual mean objective is only exceeded at one location, (although 4 monitoring sites within the AQMA, including the site where we locate 3 tubes together for quality control purposes, recorded levels within 10% of the objective) and at all other monitoring locations it continues to be comfortably met.

The 2005 – 2019 Forest of Dean District Council Air Quality reports are available online at:

## Actions to Improve Air Quality

Lydney Air Quality Management Area (AQMA) was declared in July 2010 and a subsequent “Further Assessment” was submitted to Defra in June 2011. It is thought that congestion at the T junction which is in a “street canyon” (i.e. the buildings by the roadside are high compared to the width of the road, preventing exhaust emissions from dispersing easily) was the cause of the previously higher NO<sub>2</sub> levels.

Since the “Further Assessment”, there has been an investigation into options to improve air quality in the AQMA. The key change, that may have brought about the required improvement, is the introduction of a 20 mph speed limit in Lydney High Street; it is thought that this had the effect of relieving congestion at the T junction, as drivers on the main road more readily give way to exiting traffic when moving more slowly. Conditions have not worsened at this location.

Gloucestershire County Council is responsible for strategies relating to traffic management across the county. Further details of these strategies can be found at <http://www.gloucestershire.gov.uk/ltp3>

The Overarching Transport Strategy is supported by further policy documents relating to: Bus, Cycle, Freight, Highways, Rail and Think Travel.

## Conclusions and Priorities

The nitrogen dioxide diffusion tube monitoring programme will continue and we will review results on a monthly basis, as they are received. We will work with our Planning Department and the County Planning and Highways Departments to ensure that developers of agreed new developments consider potential air quality impacts from the outset, so as not to cause undue deterioration of air quality in the District. We will follow national guidance to ensure air quality impacts are assessed for proposed developments and that any potential adverse impacts are mitigated as necessary.

Over the coming year a priority is to encourage other forms of transport use in the Forest of Dean District and in particularly within the Lydney area. Here a new scheme is providing a new network of cycleways linking key parts of the town centre with outlying areas, such as Aylburton. The scheme is under construction at the time of writing. More information can be found here:

<https://www.gloucestershire.gov.uk/highways/major-projects-list/lydney-cycling-improvements/>

## Local Engagement and How to get Involved

Public participation is integral to effective air quality management. We can all play our part in improving air quality in our area. You could consider taking the train or bus, cycling or even walking for short journeys rather than taking the car. Switching off the car engine when you are stationary or parked rather than leaving it idling reduces pollution and is especially important outside schools and other sensitive areas. Sharing regular car journeys to work reduces amounts of traffic on the roads at peak hours. These are all ways in which we could reduce pollution and traffic congestion in our locality.

So, before using your car, ask yourself:

- Do I really need to make this journey?
- Could I walk or cycle instead of taking the car and get fitter at the same time?
- Could I take a bus or train?
- Are the levels of air pollution already too high today?
- Could I car share?

Copies of the latest Air Quality Report can be found on the Council's Website at: [Forest of Dean District Council - Air Quality pages](#)

Any queries about Air Quality should be directed to the Environmental Protection team within Forest of Dean District Council.

This team can be contacted by email on: [ers@fdean.gov.uk](mailto:ers@fdean.gov.uk)

## 1 Local Air Quality Management

This report provides an overview of air quality in Forest of Dean District Council's area during 2019. It fulfils the requirements of Local Air Quality Management (LAQM) as set out in Part IV of the Environment Act (1995) and the relevant Policy and Technical Guidance documents.

The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where an exceedance is considered likely the local authority must declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives. This Annual Status Report (ASR) is an annual requirement showing the strategies employed by Forest of Dean District Council to improve air quality and any progress that has been made.

The statutory air quality objectives applicable to LAQM in England can be found in Table E.1 in Appendix E.

## 2 Actions to Improve Air Quality

### 2.1 Air Quality Management Areas

Air Quality Management Areas (AQMAs) are declared when there is an exceedance or likely exceedance of an air quality objective. After declaration, the authority must prepare an Air Quality Action Plan (AQAP) within 12-18 months setting out measures it intends to put in place in pursuit of the objectives.

The Forest of Dean District Council declared Lydney AQMA in July 2010. The details will be found in Table 2.1.

This AQMA was designated in relation to a likely breach of the nitrogen dioxide (annual mean) objective as specified in the Air Quality Standards Regulations 2007.

The outlined area on the map in Figure 2.1 shows the designated AQMA in Lydney, which incorporates roads affronting residential properties in High Street, Hill Street and Newerne Street from Temple Way junction (A) to Albert Street Junction (D); and Bream Road from High Street junction (B) to approximately 75m past the entrance to Lydney Church of England Primary School (F); and Forest Road from Hill Street (C) to just past 17 Forest Road (E). A more detailed plan showing the locations of monitoring points within the AQMA will be found of Appendix D.

Figure 2.2 shows that changes in the nitrogen dioxide concentrations measured within our Lydney AQMA since 2012. Comparing the last three or four years' data with those of 2012 it can be seen that at the 7 sites where the readings were the highest in 2012 (around  $40\mu\text{g}/\text{m}^3$  or above) there has been a decrease in levels. This year, with the exception of location LYD01, at 57 High Street Lydney, all measured levels within the AQMA are below the  $40\mu\text{g}/\text{m}^3$  national objective (marked with a black line on the graph in Figure 2.2). At all the other sites, where the concentration did not exceed  $40\mu\text{g}/\text{m}^3$  in 2012, the levels have not changed significantly since that time.

## 2.2 Progress and Impact of Measures to address Air Quality in Forest of Dean District

An Air Quality Action Plan (AQAP) was drafted in 2015 and consultations undertaken. Various options were assessed and assigned scores. Those options scoring 20 or more were considered to be the most feasible and cost effective options for positive air quality impacts in the town centre.

There were 8 options which score higher than 20, as detailed below:

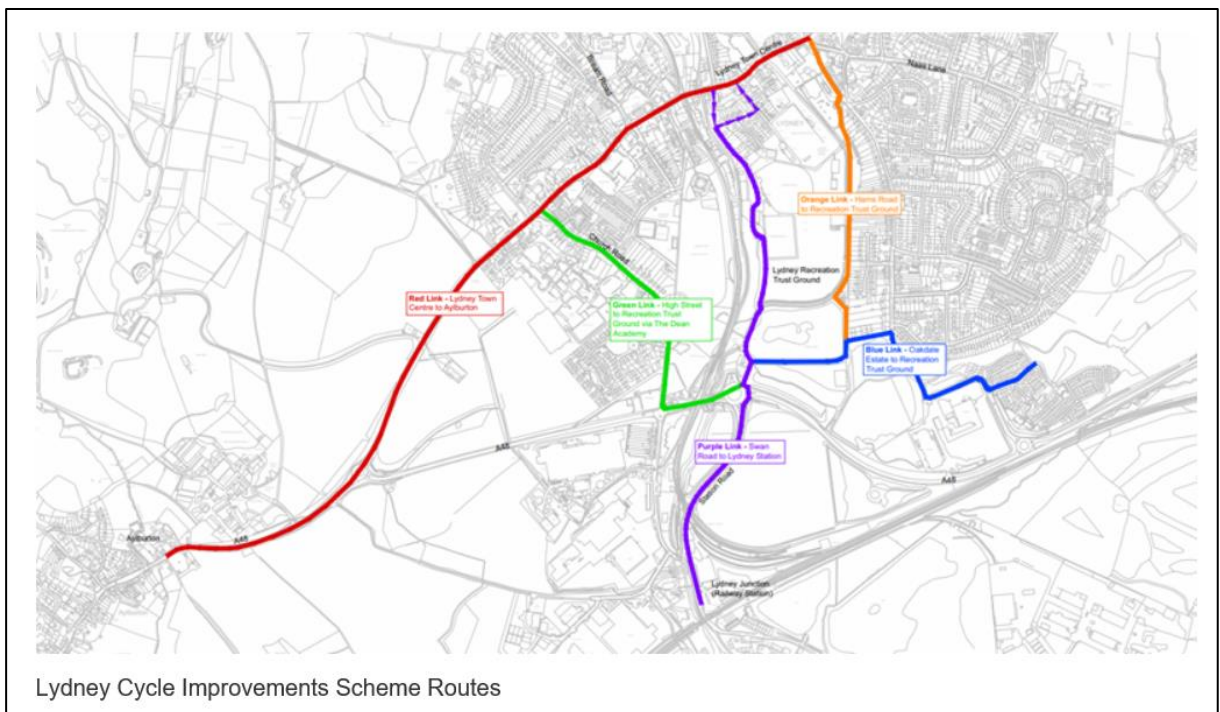

- Option 1 - Action Schemes to encourage alternative transport
- Option 2 - Bream Road – Signalisation
- Option 7 - Switch off engines at heritage railway level crossing whilst idling
- Option 8 - Reduce parking near Lydney C of E School and encourage parking in car park at the bottom of Bream Road
- Option 10 - Promote regular HGV servicing and emission testing to ensure cleaner running vehicles
- Option 13 - Newerne Street Link
- Option 14 - Improve rail services and facilities
- Option 15 - Other public transport services

Option 1 aligns with Gloucestershire County Council's LTP regarding 'smarter choices', their 'Active Together' scheme and their 'Connecting Places' proposals. It provides low cost methods to encourage mode shift from the private car.

Options 2 and 13 have been promoted by the Council as part of the Forest of Dean District Council Infrastructure Delivery Plan (2015, [Infrastructure Plan Link to: infrastructure plan](#) ) and funding is either provisionally available or is being actively sought.

Options 7, 8 and 10 are not necessarily straightforward to implement.

Options 14 and 15 involve other organisations, e.g. Network Rail, Great Western Trains, Transport for Wales, Stagecoach, Forest of Dean Community Transport Partnership, etc. Improvements put forward include improvements to station car parking and providing a cycle link from the town centre to the railway, with cycle parking at each end of the scheme. Cycleway improvements have already been commenced (see Table 2.2, Measure 2) – the “Purple Link” will provide an off-carriageway route from Lydney railway station to the Town Centre. A plan showing the scope of the completed scheme is shown below:

The introduction of a 20 mph speed limit in Lydney High Street, already completed, is thought to have had the effect of relieving congestion at the T junction, as drivers on the main road more readily give way to exiting traffic when moving more slowly.

## 2.3 PM<sub>2.5</sub> – Local Authority Approach to Reducing Emissions and/or Concentrations

### 2.3.1 General Approach

As detailed in Policy Guidance LAQM.PG16 (Chapter 7) (Reference D), local authorities are expected to work towards reducing emissions and/or

concentrations of PM<sub>2.5</sub> (particulate matter with an aerodynamic diameter of 2.5µm or less). There is clear evidence that PM<sub>2.5</sub> has a significant impact on human health, including premature mortality, allergic reactions, and cardiovascular diseases.

Other than the potential source from vehicles, no other significant source of PM<sub>2.5</sub> has been identified within the District. Therefore the control at this stage is aligned with the measures designed to achieve a reduction in vehicular emissions. The Forest of Dean does not have any smoke control areas.

Partnership working with the county-wide Gloucestershire Pollution Group has included liaison with Gloucestershire County to coordinate air quality policy.

### **2.3.2 Public Health Outcomes Framework**

PM<sub>2.5</sub> is the pollutant which has the biggest impact on public health and on which the Public Health Outcomes Framework (PHOF) indicator 3.015 is based<sup>4</sup>.

The importance of the effect of air pollution on public health is reflected by the inclusion of an indicator of mortality associated with air pollution in the Public Health Outcomes Framework. This is a series of “indicators” prepared by Central Government as a measure of public health in various categories and across the regions of the UK. One category of data is “D01 - Fraction of mortality attributable to particulate air pollution” (2017).

For Gloucestershire as a whole, the estimated Fraction of Mortality attributable to particulate air pollution is ranked 6 out of 16 areas in the South West of England. This equates to a percentage of 4.7% compared with the regional average of 4.4%.

For the Forest of Dean district, the estimated Fraction of mortality attributable to particulate air pollution is relatively low with the area ranked 23 out of 37

---

<sup>4</sup> Source: Background annual average PM<sub>2.5</sub> concentrations for the year of interest are modelled on a 1km x 1km grid using an air dispersion model, and calibrated using measured concentrations taken from background sites in Defra's Automatic Urban and Rural Network (<http://uk-air.defra.gov.uk/interactive-map>.) Data on primary emissions from different sources and a combination of measurement data for secondary inorganic aerosol and models for sources not included in the emission inventory (including re-suspension of dusts) are used to estimate the anthropogenic (human-made) component of these concentrations. By approximating LA boundaries to the 1km by 1km grid, and using census population data, population weighted background PM<sub>2.5</sub> concentrations for each lower tier LA are calculated. This work is completed under contract to Defra, as a small extension of its obligations under the Ambient Air Quality Directive (2008/50/EC). Concentrations of anthropogenic, rather than total, PM<sub>2.5</sub> are used as the basis for this indicator, as burden estimates based on total PM<sub>2.5</sub> might give a misleading impression of the scale of the potential influence of policy interventions (COMEAP, 2012).

areas in the South West of England. This equates to a percentage of 4.3% compared with the regional average of 4.4%.

## **3 Air Quality Monitoring Data and Comparison with Air Quality Objectives and National Compliance**

### **3.1 Summary of Monitoring Undertaken**

This section sets out what monitoring has taken place and how the results compare with the national objectives, set to protect health.

#### **3.1.1 Non-Automatic Monitoring Sites**

Forest of Dean District Council undertook non- automatic (passive) monitoring of NO<sub>2</sub> at 30 sites during 2019. We exposed 3 tubes at one site (61 High Street, Lydney) within the AQMA for Quality Control purposes, so we have 32 results each month. Table A.1 in Appendix A shows the details of the sites.

Maps showing the location of these monitoring sites are provided in Appendix D. Further details on Quality Assurance/Quality Control (QA/QC) for the diffusion tubes, including bias adjustments and any other adjustments applied (e.g. “annualisation” and/or distance correction), are included in Appendix C.

Some changes were made to the locations of tubes during 2019. The monitoring site at Aylburton (26 High Street) was discontinued after 3 months because of consistently low nitrogen dioxide concentrations measured there (well within the national objective level). Detailed analysis of this data has not been carried out at this location because of the small amount of data collected. Monitoring at a second location, Bream (High Street) was also discontinued for similar reasons (after 6 months) and this larger data set has been included in the analysis. New locations were set up at Longhope (Knapp House, Monmouth Road) and Tutshill (Beachley Rd - Wyedean School), operational for 9 months and 4 months respectively.

#### **3.1.2 Automatic Monitoring Sites**

Forest of Dean District Council does not currently operate any automatic monitors within its district.

## 3.2 Individual Pollutants

The air quality monitoring results presented in this section are, where relevant, adjusted for bias<sup>5</sup>, “annualisation” (where the data capture falls below 75%), and distance correction<sup>6</sup>. Further details on adjustments are provided in Appendix C.

### 3.2.1 Nitrogen Dioxide (NO<sub>2</sub>)

The focus of our monitoring has been measurement of concentrations of nitrogen dioxide. The locations of individual monitoring points are set out in Table A.1.

Table A.2 in Appendix A compares the ratified and adjusted monitored NO<sub>2</sub> annual mean concentrations for the past 5 years with the air quality objective of 40µg/m<sup>3</sup>. Note that the concentration data presented in Table A.2 represents the concentration at the location of the monitoring site, following the application of bias adjustment and annualisation, as required (i.e. the values are exclusive of any consideration to fall-off with distance adjustment).

For diffusion tubes, the full 2019 dataset of monthly mean values is provided in Appendix B. Note that the concentration data presented in Table B.1 includes distance corrected values, only where relevant.

#### Trends

Figure 3.1 shows the trend of nitrogen dioxide levels at a representative selection of sites monitored around the district outside of our Lydney AQMA over the last 7 years to give a fuller picture of changes over the decade (trends within the AQMA area are discussed in Section 2.1).

<sup>5</sup> <https://laqm.defra.gov.uk/bias-adjustment-factors/bias-adjustment.html>

<sup>6</sup> Fall-off with distance correction criteria is provided in paragraph 7.77, LAQM.TG(16)

**Fig. 3.1 Graph showing the trend over the last 7 years of nitrogen dioxide levels around the district (outside of our AQMA)**

If we compare current monitoring results with those from 2012, it can be seen that at the sites with the highest levels ( $>25 \mu\text{g}/\text{m}^3$ ) there has been a gradual decrease in nitrogen dioxide levels. Levels at most of the other sites have remained broadly similar - with the exception of one location (Cinderford - 167 High St) where a slight increase was noted, concentrations measured have decreased or remained similar this year compared with 2018. However it can be clearly seen that the nitrogen dioxide levels outside of the AQMA are well below the national standard of  $40\mu\text{g}/\text{m}^3$  which is marked by a green line at the top of the graph.

The results of monitoring within our Lydney AQMA demonstrated that away from the Bream junction with Hill Street and High Street, the levels are as expected near busy roads. They range from  $19.0 - 34.2\mu\text{g}/\text{m}^3$ . No other locations being monitored in the District experienced annual average levels above  $30\mu\text{g}/\text{m}^3$  once bias adjustment had been carried out. There were three locations within the AQMA, close to the junction, where the results lay within

## Forest of Dean District Council

10% of the national air quality objective, after distance correction. These were as follows:

<b>Tube reference</b>	<b>Location</b>	<b>Nitrogen dioxide concentration (<math>\mu\text{g}/\text{m}^3</math>) (adjusted)</b>
LYD 01	57 High Street	40.7
LYD 08	13 Bream Road	36.6
LYD 16	55 High Street	37.5

As these levels within our AQMA still lie above or within 10% of the national air quality objective, we have not rescinded the AQMA designation.

**Notes:**

Exceedances of the NO<sub>2</sub> annual mean objective of 40µg/m<sup>3</sup> are shown in **bold**.

NO<sub>2</sub> annual means exceeding 60µg/m<sup>3</sup>, indicating a potential exceedance of the NO<sub>2</sub> 1-hour mean objective are shown in **bold and underlined**.

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

(3) Means for diffusion tubes have been corrected for bias. All means have been “annualised” as per Boxes 7.9 and 7.10 in LAQM.TG16 if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

(4) Concentrations are those at the location of monitoring and not those following any fall-off with distance adjustment.

# Appendix C: Supporting Technical Information / Air Quality Monitoring Data QA/QC

## Diffusion Tube Bias Adjustment Factors

The diffusion tubes (20% TEA in water) were supplied and analysed by Gradko. The tubes at all locations have a monthly exposure period. A bias adjustment factor of 0.93, based upon 27 studies, was obtained via the national bias spreadsheet, and this was applied to all diffusion tubes. This spreadsheet is available at:

<http://laqm.defra.gov.uk/bias-adjustment-factors/national-bias.html>

The details are given in the table below.

**Table C1 National Bias Adjustment Spreadsheet**

National Diffusion Tube Bias Adjustment Factor Spreadsheet				Spreadsheet Version Number: 03/20						
Follow the steps below in the correct order to show the results of relevant co-location studies							This spreadsheet will be updated at the end of June 2020			
Data only apply to tubes exposed monthly and are not suitable for correcting individual short-term monitoring periods							LAQM Helpdesk Website			
Whenever presenting adjusted data, you should state the adjustment factor used and the version of the spreadsheet							This spreadsheet will be updated every few months; the factors may therefore be subject to change. This should not discourage their immediate use.			
The LAQM Helpdesk is operated on behalf of Defra and the Devolved Administrations by Bureau Veritas, in conjunction with contract partners AECOM and the National Physical Laboratory.				Spreadsheet maintained by the National Physical Laboratory. Original compiled by Air Quality Consultants Ltd.						
Step 1:	Step 2:	Step 3:	Step 4:							
Select the Laboratory that Analyses Your Tubes from the Drop-Down List	Select a Preparation Method from the Drop-Down List	Select a Year from the Drop-Down List	Where there is only one study for a chosen combination, you should use the adjustment factor shown with caution. Where there is more than one study, use the overall factor <sup>†</sup> shown in blue at the foot of the final column.							
If a laboratory is not shown, we have no data for this laboratory.	If a preparation method is not shown, we have no data for this method at this laboratory.	If a year is not shown, we have no data.	If you have your own co-location study then see footnote <sup>†</sup> . If uncertain what to do then contact the Local Air Quality Management Helpdesk at <a href="mailto:LAQMhelpdesk@uk.bureauveritas.com">LAQMhelpdesk@uk.bureauveritas.com</a> or 0800 0327953

## Annualisation

Where monitoring has been completed for less than 75% of the year, annualisation techniques can be used to estimate an annual average from a part year average. For annualisation to be completed there must be 3 months of monitoring data available. Monitoring at 3 sites was carried out only part year as the monitoring locations were only set and operational for parts of 2019, meaning that data was only made available for 8 months of the year. These sites are:

- AYL01 Aylburton, 26 High Street
- BRE01 Bream, High St
- TUT02 Tutshill - Beachley Rd - Wyedean School

At a fourth site (Longhope, Knapp House, Monmouth Road) the position was set up at the beginning of March but capture was 75% and thus annualisation at this location was not required.

A measured mean concentration for the respective periods of exposure is available for each location. However it will be necessary to estimate the annual mean for these 3 locations, for comparison with the annual target concentration, because of less than 75% availability for this area.

The procedure involves the following steps:

1. Identification of two to four nearby, long-term, continuous monitoring sites, ideally those forming part of the national network. The data capture for each of these sites should ideally be at least 85%. These sites should be background (Urban Background, Suburban or Rural) sites to avoid any very local effects that may occur at Urban Centre, Roadside or Kerbside sites, and should, wherever possible lie within a radius of about 50 miles. If no background sites are available, and the site to be annualised is itself a Urban Centre, Roadside or Kerbside site, then it is permissible to annualise using roadside or kerbside sites rather than background sites.

The nearest sites that have characteristics similar to the areas requiring annualisation are the two AURN sites located in Bristol (St Pauls) and Chepstow, respectively. Both are located in suburban rather than major urban settings, to approximate to the situation for comparison in Lydney:

## Forest of Dean District Council

- Bristol St Pauls: the monitoring station is located within the car park of a day nursery. The monitoring station is approximately 30 metres south east of Wilder Street, a lightly trafficked urban back street. The surrounding area is primarily residential, with some commercial premises in the immediate vicinity.
  - Chepstow: the monitoring station is located on the north side of the A48 Newport Road at the junction with Hardwick Hill Lane. The surrounding area is open with residential dwellings.
2. Obtain the annual means, 'Am', for the calendar year for these sites.
  3. Work out the period means, 'Pm', for the period of interest, in this case:
    - Jan-Mar 2019 for AYL01
    - Jan-Jun 2019 for BRE01
    - Sep-Dec 2019 for TUT02
  4. Calculate the ratio, 'R', of the annual mean to the period mean ('Am/Pm') for each of the sites.
  5. Calculate the average of these ratios, 'Ra'. This is then the annualisation factor.
  6. Multiply the measured period mean concentration 'M' by this annualisation factor Ra to give the estimate of the annual mean for 2019.

At the 3 sites, the annualisation factor is different to reflect the different exposure months. See Table C2. For the diffusion tube location Aylburton AYL01, the best estimate of the annual mean in 2019 is  $0.77 \times 30.2 \mu\text{g}/\text{m}^3 = 23.3 \mu\text{g}/\text{m}^3$ , using data set out in the table below. For the BRE01, Bream tube, the best estimate of the annual mean in 2019 (again using the table below) is  $0.93 \times 20.7 \mu\text{g}/\text{m}^3 = 19.3 \mu\text{g}/\text{m}^3$ . For the Tutshill location, the annual mean is  $1.02 \times 16.7 \mu\text{g}/\text{m}^3 = 17.0 \mu\text{g}/\text{m}^3$ . These figures are then further adjusted for bias by multiplication with 0.93 (from the national spreadsheet, Table C1) to  $21.7 \mu\text{g}/\text{m}^3$  (AYL01),  $17.9 \mu\text{g}/\text{m}^3$  (BRE01) and  $15.8 \mu\text{g}/\text{m}^3$  (TUT02).

**Table C2** Annualisation Data – (units  $\mu\text{g}/\text{m}^3$ )

Site	Annual Average Am	Period Mean Pm			Ratio Am/Pm		
		Jan-Mar 2019	Jan-Jun 2019	Sep-Dec 2019	Jan-Mar 2019	Jan-Jun 2019	Sep-Dec 2019
AYL01 BRE01 TUT02		30.2	20.7	16.74			
AURN Bristol St Pauls (Background)	22.83	27.3	22.3	25.5	0.84	1.02	0.90
AURN Chepstow (Background)	13.44	54.6	46.3	33.7	0.71	0.84	1.15
Annualisation Factor					0.77	0.93	1.02

### Distance Corrections

Corrections for distance have been made that allow for the distance the diffusion tubes are from the roadside. The data to feed into this calculation, that is distance of measurement/receptor from kerb, the mean  $\text{NO}_2$  are to be found in Table A1 and B1 respectively. The correction has only been made where the adjusted annual mean is close to the national objective ( $40 \mu\text{g}/\text{m}^3$ ). This applied to two locations in Lydney.

In both cases the correction has made only minor difference to the estimated receptor concentration because in most cases the diffusion tube monitors are close to both the roadside and to the nearest relevant receptor (residential building). An example of the output from the calculation is seen below:

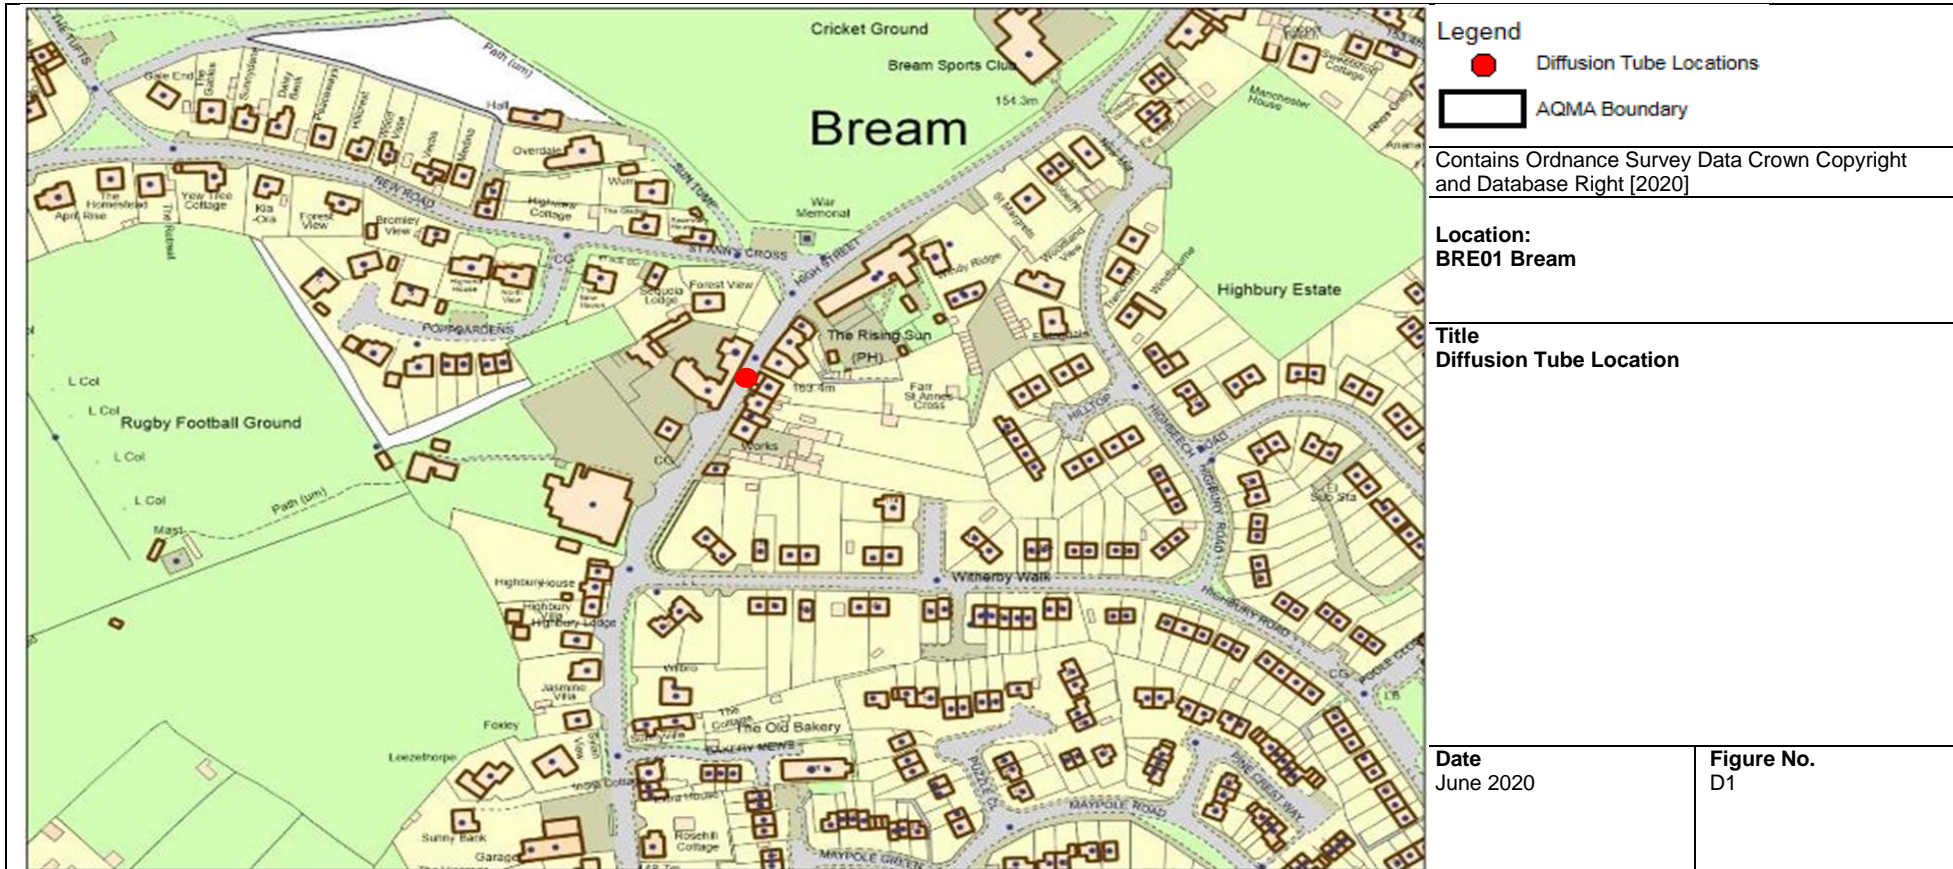

LYD01 Lydney - 57 High St

Enter data into the pink cells

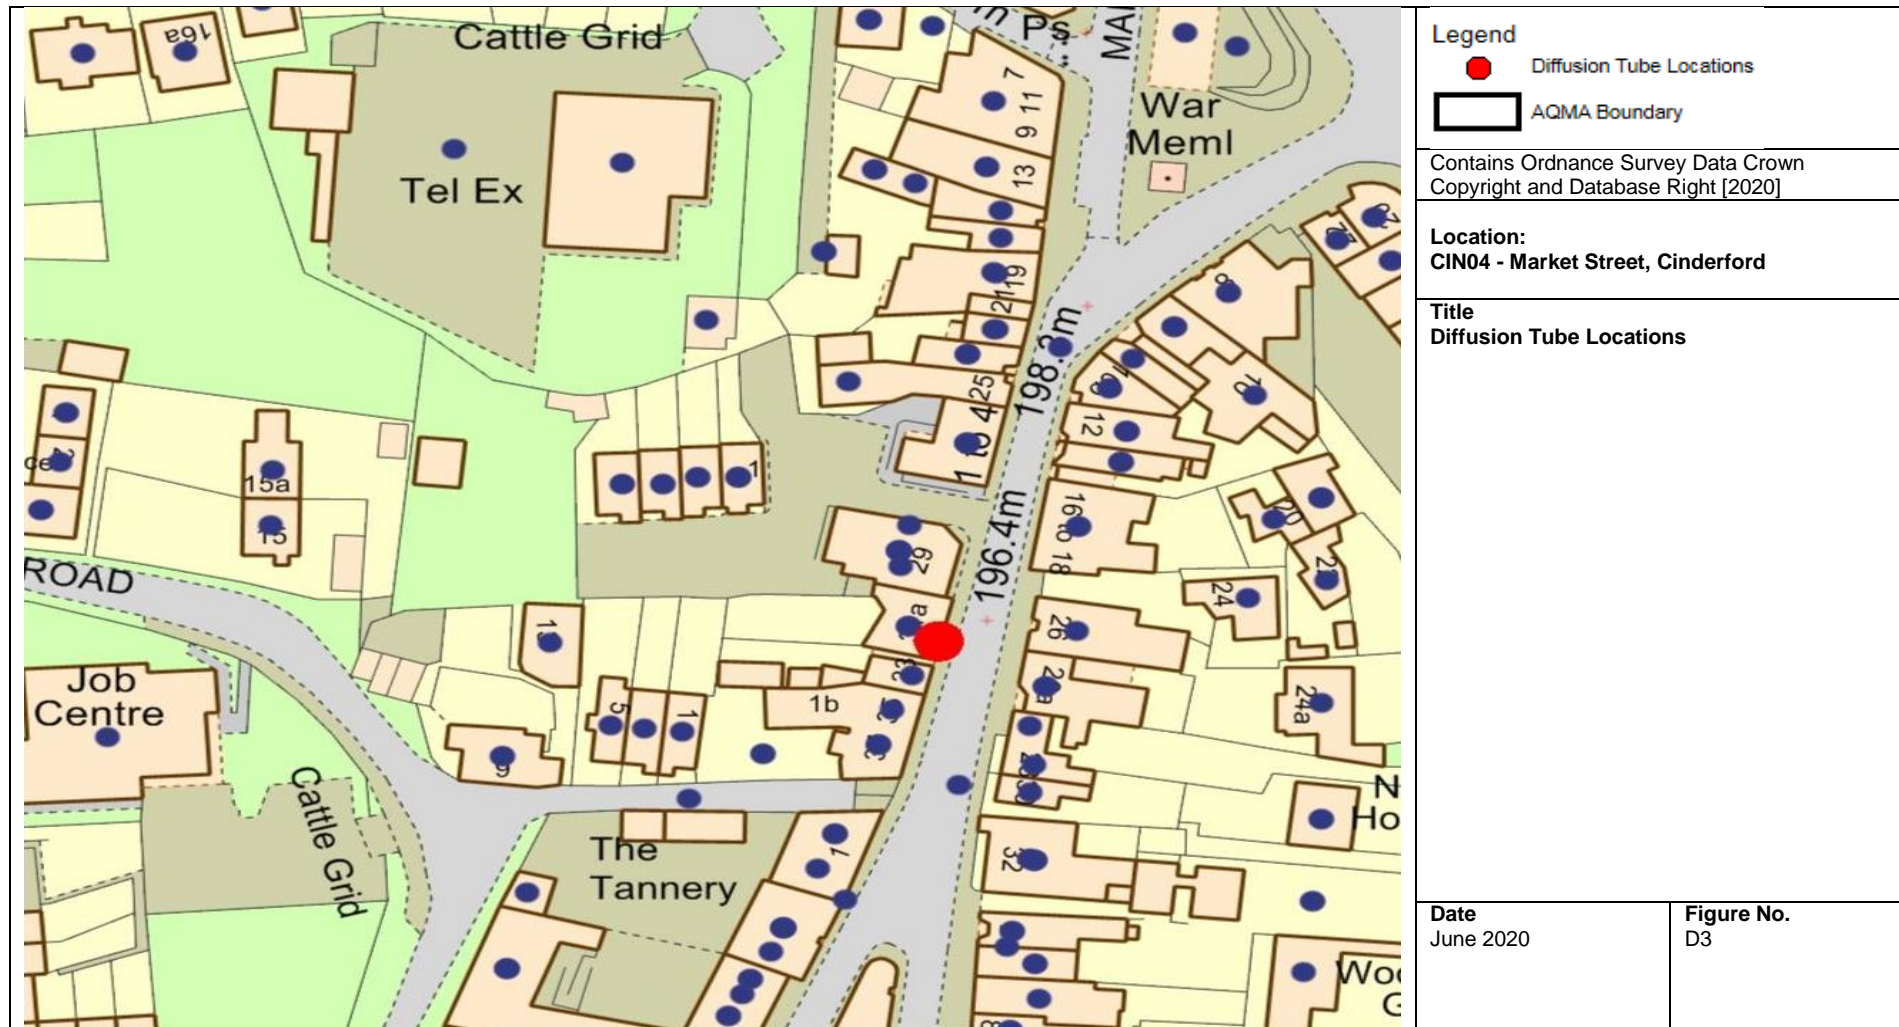

Step 1	How far from the KERB was your measurement made (in metres)?	3.4	metres
Step 2	How far from the KERB is your receptor (in metres)?	3.5	metres
Step 3	What is the local annual mean background $\text{NO}_2$ concentration (in $\mu\text{g}/\text{m}^3$ )?	7.6	$\mu\text{g}/\text{m}^3$
Step 4	What is your measured annual mean $\text{NO}_2$ concentration (in $\mu\text{g}/\text{m}^3$ )?	40.93	$\mu\text{g}/\text{m}^3$
Result	The predicted annual mean $\text{NO}_2$ concentration (in $\mu\text{g}/\text{m}^3$ ) at your receptor	40.7	$\mu\text{g}/\text{m}^3$

## Appendix E: Summary of Air Quality Objectives in England

Table E.1 – Air Quality Objectives in England

Pollutant	Air Quality Objective <sup>7</sup>	
	Concentration	Measured as
Nitrogen Dioxide (NO <sub>2</sub> )	200 µg/m <sup>3</sup> not to be exceeded more than 18 times a year	1-hour mean
	40 µg/m <sup>3</sup>	Annual mean
Particulate Matter (PM <sub>10</sub> )	50 µg/m <sup>3</sup> , not to be exceeded more than 35 times a year	24-hour mean
	40 µg/m <sup>3</sup>	Annual mean
Sulphur Dioxide (SO <sub>2</sub> )	350 µg/m <sup>3</sup> , not to be exceeded more than 24 times a year	1-hour mean
	125 µg/m <sup>3</sup> , not to be exceeded more than 3 times a year	24-hour mean
	266 µg/m <sup>3</sup> , not to be exceeded more than 35 times a year	15-minute mean

<sup>7</sup> The units are in microgrammes of pollutant per cubic metre of air (µg/m<sup>3</sup>).

## Glossary of Terms

Abbreviation	Description
AQAP	Air Quality Action Plan - A detailed description of measures, outcomes, achievement dates and implementation methods, showing how the local authority intends to achieve air quality limit values'
AQMA	Air Quality Management Area – An area where air pollutant concentrations exceed / are likely to exceed the relevant air quality objectives. AQMAs are declared for specific pollutants and objectives
ASR	Air quality Annual Status Report
Defra	Department for Environment, Food and Rural Affairs
DMRB	Design Manual for Roads and Bridges – Air quality screening tool produced by Highways England
EU	European Union
FDMS	Filter Dynamics Measurement System
LAQM	Local Air Quality Management
NO <sub>2</sub>	Nitrogen Dioxide
NO <sub>x</sub>	Nitrogen Oxides
PM <sub>10</sub>	Airborne particulate matter with an aerodynamic diameter of 10µm (micrometres or microns) or less
PM <sub>2.5</sub>	Airborne particulate matter with an aerodynamic diameter of 2.5µm or less
QA/QC	Quality Assurance and Quality Control
SO <sub>2</sub>	Sulphur Dioxide
