1	Open Areas Within Settlements	3
2	List of Sites	9

## I Open Areas Within Settlements

- 1.1** Abbreviations: FoD- Forest of Dean, the Statutory Forest, FoDD Forest of Dean, the administrative district, FoDDC Forest of Dean District Council, the Local Government body. LP - Local Plan.
- 1.2** The nature of many settlements in the FoDD and elsewhere is that their character is determined by a combination of the buildings themselves and the hard and soft surfaces between them and other structures. Many of these spaces provide a setting for a variety of uses and also support wildlife and wellbeing including recreation.
- 1.3** Open (undeveloped) areas play therefore have a key part in providing for the needs of those living in and visiting a settlement. They are often an integral part of the character of an area and may provide space for trees, protect views and routes, or cultural/ historical features. Some will host open space used for play or formal and informal games and be part of a more interconnected network of spaces.
- 1.4** The Local Plan in preparation and past plans use settlement boundaries as a tool to guide the approach to development and these set out the areas which are regarded as rural (countryside) and those where the built environment is more dominant. These areas (within settlement boundaries) impart a general feeling of being in a built area with attendant buildings, open spaces and services. Within these settlements and their defined boundaries (defined settlement boundaries, DSBs) the Local Plan identifies a suite of policies to guide development, promoting both change and conservation. It identifies specific areas for these purposes including open undeveloped areas which contribute to the nature character and or function of the defined settlements (Important Open Areas, IOAs). These vary widely from areas set aside in formal estate developments to totally informal areas of “forest waste”. They include some privately owned paddocks which have a purely visual function and many areas that contain footpaths open space used for recreation and spaces set aside for the purpose (play areas, pitches etc).
- 1.5** Almost all of the areas defined as IOAs are of value as visual amenity though some, including smaller areas within developments may be identified for their green value (actual or potential planting, watercourses, flood storage, green infrastructure etc). Most areas contribute in more than one way so they may be important visually, host a footpath, play area and GI. Many including a large number in the FoD are of cultural/ historic importance.
- 1.6** Almost all Important Open Areas (IOAs) are within settlements as their importance as open areas is to the defined settlement in which they sit. The LP seeks to protect them though their location is in a settlement within which change in the form of new (built) development is expected. Outside the defined settlements there are many areas of similar nature but their context under the LP policies and national guidance is that they will generally be protected from development because of their countryside location. The LP treats all areas outside defined settlements as if it were part of the countryside. In addition the LP protects all Forest Waste, sites of archaeological importance, ancient monuments, those of ecological importance wherever they are.
- 1.7** The few IOAs outwith settlement boundaries are considered to have sufficient importance to the settlement with which they are associated to be individually identified.
- 1.8** The FoDD district wide LPs since 1996 have all followed the general approach of identifying individual open areas within settlements that are considered worthy of protection. Though the areas themselves are reviewed at each plan making stage, many are retained from previous plans. All have

some importance to the visual amenity of the localities that they are in but increasingly are used for multiple functions including flood storage, for biodiversity, as paths and cycle routes. The areas are often under pressure for development, whether forest waste for enclosure for gardens or parking, or areas within estates for access. Individually or collectively the LP seeks to retain and enhance them. Many new developments contain a variety of formal and informal IOAs. The Design Code provides further guidance and policies seeking BNG and encouraging connected natural areas do so as well. Most IOAs are open and have public access but not all.

**1.9** Although there are overlaps in the various categories, the various IOAs have the following characteristics:

**1.10** Amenity areas- areas set aside primarily for visual amenity, these may be purpose designed when a development was built. They have varying degrees of formality, in many cases reflecting the time of and nature of the original development. May include areas not able to be developed eg steep banks, areas around watercourses etc.

**1.11** Highway verge- often set aside for visibility or to provide space between groups of dwellings. Sometimes defined by the need for a particular highway layout avoiding steep slopes or tight radii.

**1.12** Forest Waste- defined traditionally as all of the unplanted areas within the FoD, includes many open areas within settlements some having the appearance of highway verges, others containing remnants of past industry (eg spoil heaps, tramways). Some are very attractive containing trees, while others open grassed areas which do or did depend on grazing to maintain their appearance. All have open access and many contain paths and tracks. While all are protected by the LP these areas are a very important characteristic of the locally distinctive FoD and are vulnerable to change.

**1.13** Enclosed areas- Within many settlements there remain undeveloped but enclosed areas typically paddocks and some former or actual orchards. While there is no public access to these they do form an important part of the character of the various settlements, whether complementing areas of forest waste or providing gaps and views in some of the villages within the agricultural areas in the north of the district.

**1.14** Some IOAs including a few very small areas are identified because they provide the setting for specific features such as war memorials and crosses. While very unlikely to be under any threat they are clearly important areas worthy of protection.

**1.15** The above analysis looks at individual characteristics of each but with the knowledge that there is considerable overlap between them. An area that is protected as Forest Waste may for example also be a highway verge. Many of the protected areas within housing estates are highway verges designed into their overall layout being of a formal or semi formal geometry but function as green spaces for amenity as well as being simple verges.

**1.16** In order to assess the actual availability of recreation space set out for play and games including formal pitches and equipped play areas, the LP identifies land which is used for this purpose. Most of these areas are also IOAs though some which lie outside the defined settlements do not. Areas used for recreation are protected for their use. The actual number of polygons in each category below reflects the way in which they are drawn rather than their extent. As an example highway verges tend to be relatively small and discrete and are often dissected into several polygons whereas churchyards are much larger usually single areas.

## Forest waste<sup>1</sup>

**1.17** The boundary of the statutory forest includes a large number of parts of settlements of all sizes on the edge of land used for timber production. These fringes are often made up of built up areas interspersed with open areas of land of great amenity value. The unplanted areas of crown land within the statutory forest are known as forest waste and this forms an important landscape in its own right and is protected by the LP. Many such areas exist on the edges of the land used for timber production and on the edges of settlements.

**1.18** Many smaller settlements contain areas of forest waste which define their character. They do not have defined boundaries in the LP. These settlements are treated as part of the open countryside and the areas of forest waste are protected by the LP in its general policies on open areas, without being specifically identified on the policies map. Some adjoin planted areas cropped for timber while others do not.

**1.19** Some larger settlements in and around the edge of the FoD which have defined boundaries are partly or wholly inset into the forest and include open areas that are still owned by the crown. These areas are individually identified in the LP as important open areas and are protected from development. They vary in size from highway verges to large open spaces but all make a contribution to the character of the areas concerned whether by defining irregular open spaces between buildings, providing a setting for paths and tracks or a combination of these, or for another purpose. There are about 112 separate polygons defined in the LP as Forest waste with an average size of 0.41 ha. While the sum of the protected areas that are identified individually amounts to a small fraction of all forest waste it is important to define them in the LP because it is within the defined settlements that most development will be directed and therefore areas that are protected from development need to be identified. Past FoDD LPs have always identified the importance of local character and have protected areas such as forest waste but there is now wider support from government in requiring district wide coverage by design codes one aim of which is to protect important local characteristics. Forest waste and the distinct settlement fringes overall feature as an important aspect of the landscape character and will continue to be protected. (see also landscape Character Assessment P87 section 5)

**1.20** Some areas of forest waste are well kept and are of obvious amenity value in many cases benefitting from being grazed by sheep so they tend to be grassed open spaces. Others may be less well kept and may be used for parking and others may be more overgrown. Nonetheless they make a contribution to the character of the area and their protection is considered necessary and is a step towards their enhancement.

**1.21** The distinct nature of the FoD comes from a range of sometimes subtle characteristics such as kerbless highways, irregular walling forming boundaries which are themselves irregular, plots which vary in size and are almost haphazard and open spaces between them, as well as paths and tracks serving buildings and giving wider access. The FoD is access land and serves as informal space and a setting for many of the settlements around and within it. The value of the space for mainly informal recreation is immense and the attractiveness of the land, its open access and the way in which settled areas give way to forest fringes and plantations is a vital attribute.

---

<sup>1</sup> Unenclosed and uncultivated forest land. Since 1833, it is part of the Statutory Forest and effectively means any land owned by the Forestry Commission that is not woodland. <https://www.deanverderers.org.uk/glossary.html>

### 1.22 Key characteristics of forest waste may include:

- Provide a setting and irregular fringes of developed areas
- Providing a connected open area between larger areas of open space or the forest itself-connected by a variety of routes.
- Contain remains of former industrial activity, including pit heaps
- Some complex landforms by virtue of location history etc
- Spaces between managed plantations and built up areas
- Open spaces within built up areas
- Some areas contain high quality amenity woodland
- Some contain features of note and or relief

**1.23** The main threats to areas of Forest waste come from development and from changes of its character by way of introducing formal boundaries such as kerbing or footways along highways. It can be devalued by informal parking though this may be temporary. Loss to development is more significant although the sale of such areas for development does not generally occur, small areas are sometimes enclosed unofficially and access created.

**1.24** Larger areas are unlikely to be threatened because sales and changes of use are unlikely.

### Amenity areas- not associated with estate developments

**1.25** Outside the FoD there are many areas which include formal and informal open areas but which are not a part of planned estates. These may include spaces which it was not possible to develop nor desirable. Some may be irregular in shape and exist because they were less easy to develop.

### Highway verges

**1.26** As part of the development or evolution of highways there are verges used for visibility or created because of the need for certain geometries. Some are a small and some may be degraded so appear of little amenity value. However they are open green areas and have potential for improvement and management and in some cases tree planting.

### Open areas within estates

**1.27** The various open areas within estates have some common characteristics with the above but overall are part of a planned layout. Their style often betrays their age and origin with some more formal areas and others less so. Most add to the amenity of the area in which they are located and some offer scope for future planting and / or management for ecology. Many areas are highway verges but also wider amenity areas principally for visual enhancement. The LP does not identify all of the areas because of their size and it is expected that the smaller incidental spaces will be considered when any proposals for change are made. As with all IOAs their role in providing increased biodiversity should not be ignored nor their importance in connection pen green spaces.

**1.28** Past threats to these areas have included the creation of parking spaces, building on some of the larger spaces and unofficial use for parking. Parking is often in short supply within estates of some age and roads may also be relatively narrow. This creates pressure for the use of amenity land and sometimes a planned solution is preferable to allowing continued indiscriminate use. In all cases the remaining green areas should be considered, protected and enhanced where possible.

## Churchyards, cemeteries

**1.29** Churchyards and cemeteries with villages and towns are identified and protected for their value as open area and in recognition of their potential ecological historic and cultural value. Most are integral to the setting of a building or buildings many of which are Listed. Some may be threatened by changes of use of the buildings- loss of public access and potential uses as garden- and possibly the flattening of gravestones (seen as a risk due to instability).

## Car park

**1.30** A few areas are identified as providing landscaping around car parks. These may also have some potential for further enhancement or provision/ retention of amenity space being within town centres.

## Enclosed paddocks

**1.31** Although not enjoying public access enclosed paddocks are an important feature in many settlements notably with the FoD itself. The character of some settlements has changed over time as some of these have been lost and for a variety of reasons it is considered appropriate to identify individual paddocks for protection. The importance of these is highlighted for example in Pillowell Conservation Area, in Bream and Harrow Hill where along with forest waste they form much of the character. Over and above the visual amenity of such areas, often long established grass, are important for biodiversity. In both the FoD and elsewhere, areas that were once orchards are identified and protected for their continuing contribution.

**1.32** Erosion of these areas by change of use, loss of tree cover, changes of boundaries can occur. The LP can only protect them from some of these alterations.

## Allotments

**1.33** Allotments are protected by the LP and where they appear inside defined settlements are identified for this purpose.

## Informal and formal open spaces, pitches

**1.34** Some of the largest IOAs but also the most secure from the point of view of being protected are formal and informal areas used for recreation. They include formally laid out and planned areas of open space, such as parks and more informal spaces, areas primarily used for sports pitches and lakes ponds and other areas set aside for active use and amenity. Some include routes for walking and cycling, buildings used in association with the land and areas managed for biodiversity.

**1.35** Overall although separated by function in the discussion above in order to explain their nature, the first consideration for many of the IOAs is that they are part of a network, whether with open areas outside the settlements themselves (for example areas of forest waste), joined up amenity areas making larger continuous spaces within, or need to be seen in the context of buildings. Connected open spaces with potential for increased biodiversity will be increasingly important in the new LP and so will the promotion of areas with several functions. These may include flood storage, green infrastructure, active travel routes, sports areas as well as areas of value for their visual amenity. Existing open areas will be protected and new provision required under the LP.

**1.36** The importance of retaining open areas within settlements has increased since they were first identified in a LP. The threats remain but there is an increased need for spaces for multiple uses including planting of trees, flood storage as part of SUDs, wildlife areas and corridors etc. Management

regimes are shifting to less formal cutting and maintenance in some. Recent events such as the pandemic of 2020/21 heightened the need for open space for informal recreation and increased building in some areas adds pressure for open space to be delivered as an integral part of development.

**1.37** The LP will emphasise the need for open space for a variety of functions and will encourage both new provision and enhancement of existing areas, which underlines their importance.

**1.38** Smaller IOAs in particular may not always appear to be attractive in their present condition. They remain important to their setting or settlement and the potential for improvement means that they will retain the protection accorded by the LP. Enhancements such as planting, or removal from use for parking may change this.

**1.39** Some loss of IOAs is inevitable but equally new areas are expected to be created as development occurs. Where redevelopment takes place there will be a requirement for open space as an integral part of development and it is more likely to be serving a multiple use than some of the past amenity areas such as those set out in housing built some time ago.

**1.40** All LP policies need to be read together and the protection of IOAs is only a part of one. It must be seen in the context of any design guidance, ecology, recreation and climate orientated policies as well as the overall approach to the various settlements and their conservation, conservation areas and other policies such as the locally distinctive areas identified in some. Here especially, the importance of IOAs alongside the retention of particular attributes is especially important.
